How the diesel cooker works

The heat generated by the fuel combustion process is transferred to the ceramic surface, and the exhaust gas is directed out of the vehicle through an exhaust gas line inside the cooling air line. The vapor content of the exhaust gases therefore do not give rise to greater humidity in the vehicle. The diesel cooker's heat output is continuously adjustable. In addition a cooling fan in the ventilation box ensures that the temperature does not reach a critical limit in the installation area. Hot air is drawn off through the cooling air line. Make all of your favorite dishes inside!
